In the above example the fields `singleSRC` and `size` will be shown after the `addImage` checkbox field, when `addImage` has been activated.

## Sub palettes with selects

Instead of reacting to a checkbox, you can also define different sub palettes depending on different value for a select input field:

```
// contao/dca/tl_example.php
$GLOBALS['TL_DCA']['tl_example'] = [
    'palettes' => [
        '__selector__' => ['selectField'],
        'default' => '{title_legend},title,alias,selectField',
    ],
    'subpalettes' => [
        'selectField_value1' => 'field1,field2',
        'selectField_value2' => 'field3,field4',
    ],
];
```

In this case the sub palette key needs to be in the form of `fieldName_fieldValue`. Depending on the field's value, the appopriate sub palette will be inserted.
